

Experiment 3: Building Corporate Risk Register & Risk Taxonomy

Aim

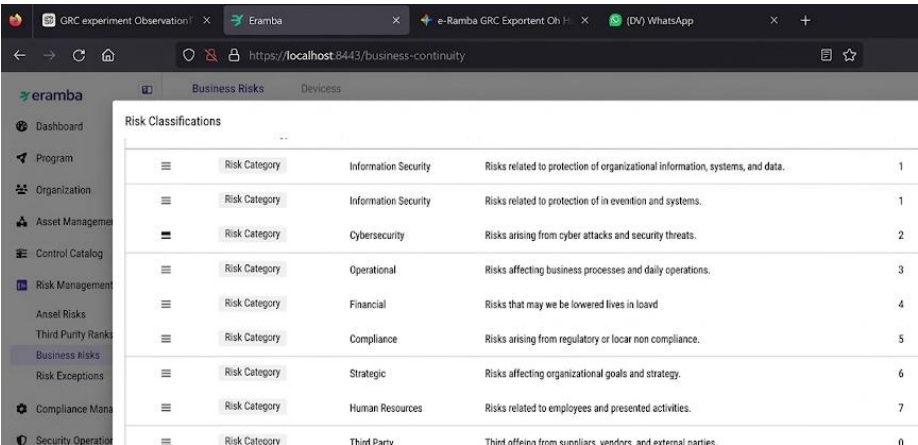

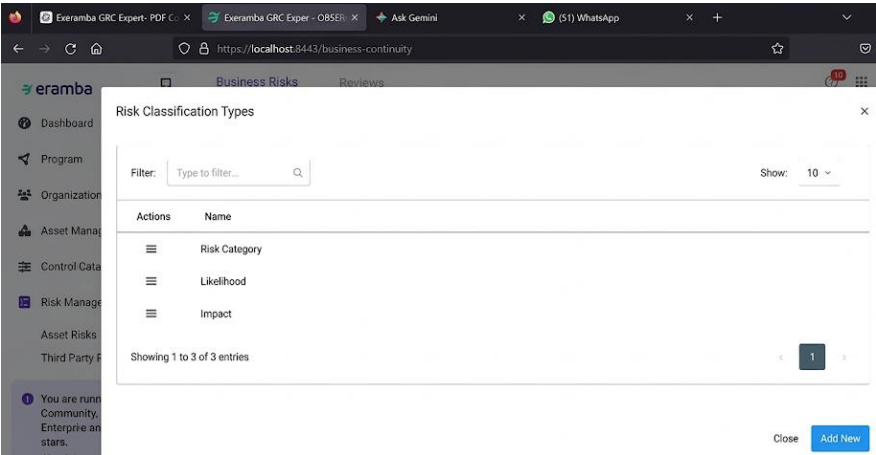

To build a structured corporate risk register and risk taxonomy in Eramba by defining risk categories, threats, vulnerabilities, and business risks.

Procedure

- 1. Navigate to Risk Management → Business Risks → Settings.
- 2. Create Risk Classification Types such as Risk Category, Likelihood, and Impact.
- 3. Add risk classifications under these types.
- 4. Review the available Threats and Vulnerabilities.
- 5. Configure the Risk Calculation Method using Likelihood and Impact.
- 6. Configure the Risk Appetite/Threshold matrix.
- 7. Create/import business risks under Risk Management → Business Risks.
- 8. Verify the completed risk register.

Output

A risk taxonomy containing classifications, threats, and vulnerabilities was established, and 10 business risks were added to the corporate risk register.

	Risk Category			
	Information Security	Risks related to protection of organizational information, systems, and data.		1
	Information Security	Risks related in protection of information and systems.		1
	Cybersecurity	Risks arising from cyber attacks and security threats.		2
	Operational	Risks affecting business processes and daily operations.		3
	Financial	Risks that may be lowered lives in inexc.		4
	Compliance	Risks arising from regulatory or local non compliance.		5
	Strategic	Risks affecting organizational goals and strategy.		6
	Human Resources	Risks related in employees and presented activities.		7
	Third Party	Thidc arising from suppliers, vendors, and external parties.		8

Result

The Corporate Risk Register and Risk Taxonomy were successfully created and configured in the Eramba GRC dashboard.
